

Communication component sizes (Simplified Dilithium-III (target): $n=6, \ell=5, \kappa=49$) — response z is 99.5% of the signature

signature = (c, z) , pre-signature = $(c, \hat{z})$, adapted = $(c, \hat{z} + r')$: all 6720 B — same encoded size because the adaptor witness r' changes the response value, it does not add a new serialized field.
